

# Better Security, Savings and Analytics

## Innovate/Audit software from LRS

### Regain control of your document environment

To reduce output costs and protect valuable information, you need to know where, when, and how much your users are printing. Innovate/Audit™ software from LRS helps you track document use across the entire organizational landscape.

Innovate/Audit software helps you analyze document use to increase savings and security

Advanced reporting and analytics capabilities aid decision makers in cost reduction, compliance, e-discovery, and environmental initiatives.

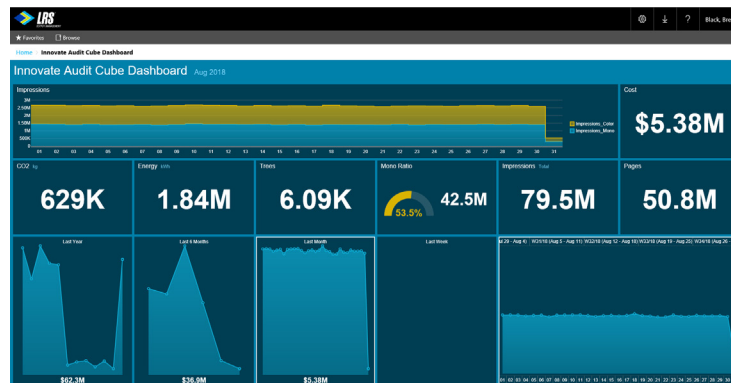

### Better analytics produce better decisions

The Innovate/Audit solution tracks more than 260 attributes related to document origin, destination, size, color/paper handling characteristics, and much more.

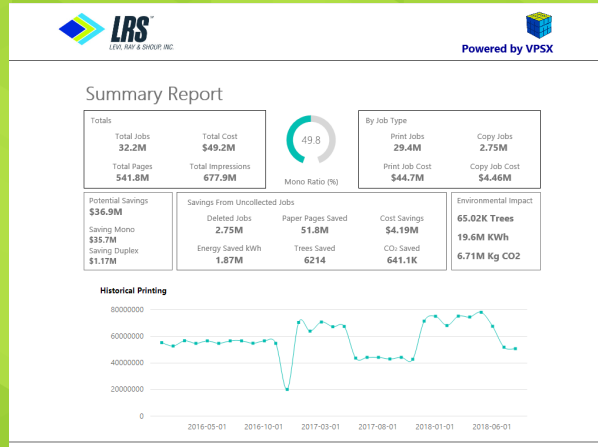

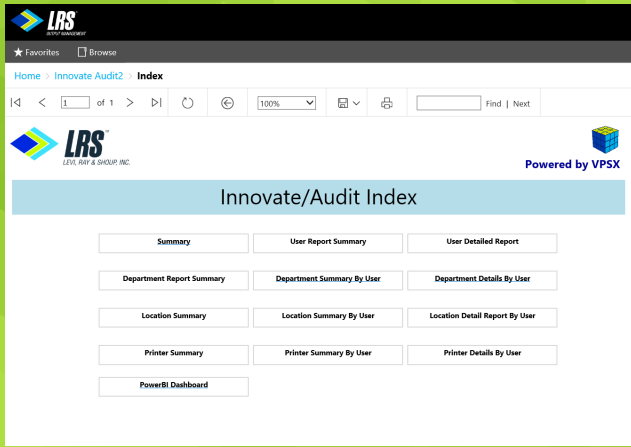

This VPSX-generated accounting data, as well as statistics gathered from individual print devices, can be analyzed using standard Innovate/Audit accounting reports. Support for OLAP Cube-based analytics lets you use a variety of tools to perform multi-dimensional analysis on your print data.

These capabilities enable you to:

- Calculate consumable use for cost recovery/chargeback
- Locate underutilized, outdated, or costly print devices
- Identify large or outdated reports no longer needed in hardcopy form
- Detect unauthorized access to sensitive information
- Find document misuse or waste on the part of users
- Validate the accuracy of your MPS vendor charges

OLAP Cube-based analytics aid in security, sustainability, and cost reduction efforts.

Standard reports included with the Innovate/Audit solution help organizations quickly identify document security risks and savings opportunities.

## Technically Speaking...

### How is Innovate/Audit software deployed?

Only a single instance of the LRS® Innovate/Audit software is required to analyze data from multiple LRS products. This software may be run on the same Windows® server where other LRS products are installed, if applicable.

### How long does it take to implement Innovate/Audit software?

In a VPSX® environment with MS SQL Server already in place, Innovate/Audit takes just minutes to deploy. You can quickly gather valuable data about your organization's use of documents using the included static reports and/or dynamic queries. To capture information about documents printed through Windows

facilities, you can initiate a batch process via System Center Operations Manager (SCOM)

### What information does the Innovate/Audit solution capture?

- Over 260 document attributes generated by LRS software during document capture, delivery and other output management processes
- Printing statistics gathered from MFPs, printers, and other devices, including page-level color metrics
- Information printed directly from Windows, Mac, Linux, and other workstations as well as virtual clients and mobile devices

### What types of reports are available?

All Innovate/Audit metadata is available for analysis using third-party reporting tools and applications

capable of analyzing OLAP cubes (e.g., Excel® PowerPivot and SQL Server Mobile Reports Publisher). In addition, LRS provides a number of built-in summary and detail reports that outline document usage as well as money and resource savings.

### How do the new Innovate/Audit reporting capabilities compare with past ones?

By replacing a flat record structure database with a data warehouse model and leveraging an OLAP cube data structure, query speed has increased by 50 – 100X. As a result, generating reports against very large databases takes a matter of seconds instead of many minutes.

# Save money, increase corporate sustainability, and improve document security by understanding your organization's document use.
